Q: How to deserialize this to FSharpList? I have a domain class like this: [] let VmFileFlags = Literal([2;9;10], "2") [] let VmFileFlagsArray = Literal([2; 9; 10], "2,9,10") and I can deserialize the literal string into this field as I usually do by type C() = member __.VmFileFlags = (Literal, VmFileFlags.CreateStringLiteral()) [] val mutable vmFileFlags: VmFileFlags But how can I deserialize VmFileFlagsArray into FSharpList? So far I did this let VmFileFlagsArray = Literal(Seq [2; 9; 10],

What's New in the?

The field of the invention is personal video recording of television programs, and particularly, the recording and subsequent viewing of live television programs. Recently, a number of memory cards have been developed in the prior art which permit a television viewer to conveniently and inexpensively record television programs for subsequent viewing. One of the simplest systems records all of the television programs that are received and stored in a random order on a single recording medium. While extremely simple and inexpensive to implement, this system does not lend itself to the recording of a live television program which must be viewed in real time. More sophisticated systems have also been developed which permit the real time recording of a television program, or portions of a television program. These systems generally employ a digital video recorder (DVR) device or a personal video recorder (PVR) device. One example of such a system is the RECORDIT! program developed by TiVo, Inc. of Sunnyvale, Calif. The RECORDIT! system permits a user to set up a playlist containing certain programs to be recorded and stores the programs in the order that they are broadcast. More recently, the user can setup and record a single program, or a continuous series of programs. Each recorded program retains its play-list context. Another system is the PLEXUS system by EchoStar of New York. The PLEXUS system also employs a digital video recorder, which permits the user to setup and record programs individually, or continuously. In addition, the PLEXUS system also permits the recording of video only to permit the user to watch particular programs even if the DVR is not recording the television program. The two types of recording systems, namely, systems which record all of the programs that are transmitted and systems which record only selected programs, have different requirements of the viewer. For example, the program or series selection of the PLEXUS system is more flexible for the viewer. However, the record programs only system has the distinct advantage that the viewer need not set-up the recording and may view the recorded television programs at any time. A PVR is disclosed in U.S. Pat. No. 6,351,490 by Hagger et al., incorporated herein by reference. The Hagger et al. patent discloses a PVR which permits a viewer to setup particular recording criteria. For example, the user may setup that only programs broadcast in the evening are recorded. Then, the viewer may play back only the evening programs recorded with the PVR.
