Review article: The cellular basis of radiation-induced apoptosis and the potential role of p53/p21 in preventing tumour cells from traversing the G1/S checkpoint. In its third phase, the p53 pathway--activated following DNA damage--contains an inhibition of cyclin dependent kinases and activation of an inhibitor of cyclin dependent kinases p21. This allows for growth arrest in the G1 phase of the cell cycle. However, few cells that have received an apoptotic death signal will make it through the G1-S checkpoint. This review will describe the evidence that p53 and p21 play key roles in apoptosis induced by ionising radiation and the potential relevance of this information
